

VERIFICATION BECOMES INFRASTRUCTURE

VERIFYD

*The verification layer for
machine-made change.*

Every proposed change should arrive with evidence, authority, and a witnessed path back.

SPEC ⊢ POLICY ⊢ EXECUTION

Raising \$1M at a \$10M
valuation

Agents multiplied change. Control stayed human-speed.

Generation is abundant. Judgment is scarce.

A model can propose code, tests, infrastructure actions, and reviews faster than a senior team can decide what may run and what the organization will own.

The product object is a governed change transaction.

What it preserves

- ▶ declared reads, writes, and external effects
- ▶ evidence, policy version, and human authority

What it enables

- ▶ deterministic policy replay
- ▶ exact withdrawal and an auditable judgment record

Verification and validation are duals. Authority is a third type.

VERIFICATION

Establishes a stated property.

Types, refinement, confinement, proof obligations.

+

VALIDATION

Attacks observed behavior.

Tests, property checks, evals, red teams, counterexamples.

≠

AUTHORITY

Decides what may run or ship.

Policy and human responsibility. Never a model self-score.

Models propose. Policy disposes. **SYSTEM LAW**

Withdraw one agent. Retain every independent contribution.

TARGET INTERACTION

```
$ verifyd withdraw B
9 effects inverted
A and C retained
user edits retained
receipt written
```

The effect carries its own inverse. Reads and writes define independence. The receipt states what moved.

First light must exercise overlapping edits. A disjoint-file demo is not enough.

Rust controls. Mojo computes. The graph connects.

The IDE, Cedar-Mojo, Nabla-Mojo, and the VGL are instruments. The verification spine is the product.

The IDE is a surface over the gate, not the company.

Keep the editor. Keep the models. Add independent authority.

- ▶ CLI for immediate workflow integration
- ▶ ACP for Zed and other agent-capable editors
- ▶ MCP and cloud seams for cross-vendor actions

A prior factory leaves measurable operating receipts.

100

about 100 merged PRs in
38 days

187,061

measured lines of Rust

1,550

Rust test functions

1.4 h

median branch lifetime

Human-orchestrated. Spec-locked. CI-gated. Three-seat review. One revert.

Independent reviewers wrote tracked reviews. The human retained merge authority.

MEASURED

This demonstrates founder execution and an operating method. It is not customer traction.

Compilers, cloud, and banking meet at the exact failure seam.

COMPILERS

Produces the analysis.

PhD, ICSE, SecureComm, Jitana, ReHAna, open-world graph loading.

CLOUD

Ships the system.

50+ engineers, 150+ internal teams, 20+ PB under regulatory continuity.

BANKING

Defends the evidence.

Nine years in banking, audit-facing controls, CFA Level I.

The north-star customer is also the builder.

Super learner. 500+ books. Sustained deep work through coding agents and local accelerators.

COMMITMENT

Self-funded travel from Toronto to ModCon.

Build first for the engineer who conducts systems.

Peak performers buy proposers. VerifyD sells disposal.

AI, systems, security, and platform engineers using multiple agents in long, deep sessions.

METRIC

accepted changes per reviewer-hour

LAND

elite individual engineers + small teams

EXPAND

AI platform + developer experience

DEEPEN

change control + evidence owners

No invented TAM. First prove that trusted agent throughput improves enough to earn payment.

VerifyD owns the point where proposal becomes responsibility.

Category	Primary object	When it acts	Authority	Middle withdrawal
Model / AI editor	proposal	before and during generation	no	no
CI / observability	execution result	after execution	partial	no
Policy engine	requested action	at one admission seam	yes	no history model
VerifyD	governed change	proposal through replay	yes	design target

Neutral where vendors cannot be.
The proposer should not be the sole authority grading its own action.

Architectural where features are shallow.
Effect identity and inverse witnesses must exist before interleaving destroys them.

Typed change creates a compounding evidence corpus.

ARCHITECTURAL MOAT

Inverse, footprint, and authority types live in the substrate.

Retrofitting them after text mutation means rebuilding the history model and every execution seam.

DATA MOAT

Every governed action deposits an adjudicated record.

Proposal, footprint, evidence, decision, inverse, and human authority remain linked.

The moat is adjudicated change, not a single verifier.

Each milestone is an observed event with a kill condition.

MECHANISM KILL

Any unexplained final-state delta blocks withdrawal promotion.

PRODUCT KILL

Low frequency or no reviewer-throughput gain changes the wedge.

COMPANY KILL

Nonrepeatable customer work does not become professional services.

\$1M funds three people for eighteen months.

\$1M

at a \$10M valuation

Founder + compiler engineer + cloud engineer

Equal \$150K salaries. Each founding engineer receives 5% equity on a four-year vest.

Compute, infrastructure, legal, design-partner operations, and contingency.

A product company. No professional services. No bridge built into the plan.

THE DECISION

Machine-made change will cross an independent gate.

VerifyD intends to own that gate.

The round buys first light, real users, and a kernel whose claims survive contact with execution.

Verification is what makes
delegation compound instead of
decay.
